In the Claims:

1. (Currently Amended) A module for facilitating operation of packet-switched telephones, the module comprising:

[[a)]] a network interface for communicating over a network; and

[[b)]] a control system operatively associated with said network interface and providing a server function adapted to control concurrent operation of a plurality of packet-switched telephones operating as clients of the server function and facilitate communications between the plurality of packet-switched telephones and other telephony devices using a first protocol for communications with the plurality of packet-switched telephones and a second protocol for communications with the other telephony devices, wherein the server function registers with a remote proxy server using the second protocol and the server function registers each of the plurality of packet-switched telephones with the remote proxy server using the second protocol such that each of the plurality of packet-switched telephones may operate concurrently.

2. (Original) The module of claim 1 further comprising a telephone interface associated with the control system and adapted to connect to one of the plurality of packet-switched telephones, the control system further adapted to interact with one of the plurality of packet-switched telephones via the telephone interface.

3. (Original) The module of claim 2 wherein the control system is further adapted to cooperate with the one of the plurality of packet-switched telephones to initially configure the one of the plurality of packet-switched telephones to work in conjunction with the module via the telephone interface.

4. (Original) The module of claim 3 wherein the control system is further adapted to facilitate telephony communications between the one of the plurality of packet-switched telephones and one of the other telephony devices via the network interface.

5. (Original) The module of claim 1 wherein the control system is adapted to provide and control operation features for the plurality of packet-switched telephones.

6. (Currently Amended) The module of claim 5 wherein the operation features define provisioned telephony functions for the plurality of ~~packet-switched telephones~~ packet-switched telephones.

7. (Currently Amended) The module of claim 5 wherein the operation features define configuration settings for the plurality of ~~packet switched telephones~~ packet-switched telephones.

8. (Original) The module of claim 5 wherein the operation features control at least one of the group consisting of keys, displays, responses, and functions of the plurality of packet-switched telephones using the first protocol.

9. (Original) The module of claim 5 wherein the control system further provides a web server function adapted to provide network access to set the operation features of the plurality of packet-switched telephones using a web browser.

10. (Original) The module of claim 9 wherein the web server function provides at least one web page providing an interface for a user to set select ones of the operation features.

11. (Currently Amended) The module of claim 1 wherein the control system is further adapted to receive, using the first protocol, an OFF-HOOK message from one of the plurality of packet-switched telephones and generate a message to the remote proxy server including identifying information for a device being called by the one of the plurality of packet-switched telephones ~~server function provides a terminal proxy server for the plurality of packet-switched telephones~~.

12. (Original) The module of claim 1 wherein the control system is further adapted to translate between the first and second protocols to facilitate communications between the plurality of packet-switched telephones and the other telephony devices.

13. (Original) The module of claim 1 wherein the second protocol is a Session Initiation Protocol.

14. (Currently Amended) A packet-switched telephone facilitating operation of other packet-switched telephones comprising:

[[a)]] a microphone and speaker configuration providing an audible interface;

[[b)]] a packet-switched network interface for communicating over a network; and

[[c)]] a control system operatively associated with said network interface and the microphone and speaker configuration, the control system providing a server function adapted to control concurrent operation of a plurality of packet-switched telephones operating as clients of the server function and facilitate communications between the plurality of packet-switched telephones and other telephony devices using a first protocol for communications with the plurality of packet-switched telephones and a second protocol for communications with the other telephony devices, wherein the server function registers with a remote proxy server using the second protocol and the server function registers each of the plurality of packet-switched telephones with the remote proxy server using the second protocol such that each of the plurality of packet-switched telephones may operate concurrently.

15. (Original) The packet-switched telephone of claim 14 wherein the control system is further adapted to facilitate telephony communications between one of the plurality of packet-switched telephone and one of the other telephony devices via the packet-switched network interface.

16. (Canceled).

17. (Original) The packet-switched telephone of claim 14 wherein the control system is adapted to provide and control operation features for the plurality of packet-switched telephones.

18. (Currently Amended) The packet-switched telephone of claim 17 wherein the operation features define provisioned telephony functions for the plurality of ~~packet-switched telephones~~ packet-switched telephones.

19. (Currently Amended) The packet-switched telephone of claim 17 wherein the operation features define configuration settings for the plurality of ~~packet switched telephones~~ packet-switched telephones.

20. (Original) The packet-switched telephone of claim 17 wherein the operation features control at least one of the group consisting of keys, displays, responses, and functions of the plurality of packet-switched telephones using the first protocol.

21. (Original) The packet-switched telephone of claim 17 wherein the control system further provides a web server function adapted to provide network access to set the operation features of the plurality of packet-switched telephones using a web browser.

22. (Original) The packet-switched telephone of claim 21 wherein the web server function provides at least one web page providing an interface for a user to set select ones of the operation features.

23. (Currently Amended) The packet-switched telephone of claim 14 wherein the control system is further adapted to receive, using the first protocol, an OFF-HOOK message from one of the plurality of packet-switched telephones and generate a message to the remote proxy server including identifying information for a device being called by the one of the plurality of packet-switched telephones ~~server function provides a terminal proxy server for the plurality of packet-switched telephones~~.

24. (Original) The packet-switched telephone of claim 14 wherein the control system is further adapted to translate between the first and second protocols to facilitate communications between the plurality of packet-switched telephones and the other telephony devices.

25. (Original) The packet-switched telephone of claim 14 wherein the second protocol is a Session Initiation Protocol.

26. (Currently Amended) A method of controlling packet-switched telephones comprising:

[[a)]] providing a server function in association with a first packet-switched telephone;

[[b)]] configuring the first packet-switched telephone and a second packet-switched telephone as clients of the server function;

[[c)]] ~~controlling operation of the first and second packet-switched telephones using the server function; and~~

[[d)]] facilitating communications between a plurality of packet-switched telephones and other telephony devices with the server function using a first protocol for communications with the plurality of packet-switched telephones and a second protocol for communications with the other telephony devices;

registering the server function with a remote proxy server using the second protocol;

controlling operation of the first and second packet-switched telephones using the server function at least in part by registering the first and second packet-switched telephones with the remote proxy server using the second protocol such that the first and second packet-switched telephones may operate concurrently.

27. (Original) The method of claim 26 further comprising providing the server function in a module and associating the module with the first packet-switched telephone.

28. (Original) The method of claim 26 wherein the server function is integrated into the first packet-switched telephone.

29. (Currently Amended) The method of claim 26 further comprising:

[[a)]] providing a web server to provide a web page configured to receive settings for operation features defining operation of one of the first or second packet-switched telephones;

[[b)]] receiving input to set operation features for the one of the first or second packet switched-telephone via the web server; and

[[c)]] setting the operation features of the first or second packet-switched telephone based on the input.

30. (Currently Amended) A ~~packet switched~~ packet-switched telephony system comprising:

[[a)]] a plurality of packet-switched telephones communicating over a packet-switched network and configured to operate concurrently as clients of a server function; and

[[b)]] a module associated with one of the plurality of packet-switched telephones comprising:

[[i)]] a network interface for communicating over a network; and

[[ii)]] a control system operatively associated with said network interface and providing the server function adapted to control concurrent operation of the plurality of packet-switched telephones and facilitate communications between the plurality of packet-switched telephones and other telephony devices using a first protocol for communications with the plurality of packet-switched telephones and a second protocol for communications with the other telephony devices[[;]], wherein the server function registers with a remote proxy server using the second protocol and the server function registers each of the plurality of packet-switched telephones with the remote proxy server using the second protocol such that each of the plurality of packet-switched telephones may operate concurrently.

31. (Currently Amended) A packet-switched telephony system comprising:

[[a)]] a plurality of first packet-switched telephones communicating over a packet-switched network and configured to operate concurrently as clients of a server function; and

[[b)]] a second packet-switched telephone comprising:

[[i)]] a microphone and speaker configuration providing an audible interface;

[[ii)]] a packet-switched network interface for communicating over a network; and

[[iii)]] a control system operatively associated with said network interface and the microphone and speaker configuration, the control system providing the server function adapted to control concurrent operation of the plurality of first packet-switched telephones operating as clients of the server function and facilitate communications between the plurality of first packet-switched telephones and other telephony devices using a first protocol for communications with the plurality of first packet-switched telephones and a second protocol for communications with the other telephony devices, wherein the server function registers with a remote proxy server using the second protocol and the server function registers each of the plurality of packet-switched telephones with the remote proxy server using the second protocol such that each of the plurality of packet-switched telephones may operate concurrently.

32. (Currently Amended) A computer readable medium including software for facilitating operation of a group of packet-switched telephones, the software comprising instructions for a computer to provide:

[[a)]] a server function adapted to:

[[i)]] control concurrent operation of a plurality of packet-switched telephones operating as clients of the server function; [[and]]

[[ii)]] facilitate communications between the plurality of packet-switched telephones and other telephony devices using a first protocol for communications with the plurality of packet-switched telephones and a second protocol for communications with the other telephony devices,

register the server function with a remote proxy server using the second protocol; and

register each of the plurality of packet-switched telephones with the remote proxy server using the second protocol such that each of the plurality of packet-switched telephones may operate concurrently.

wherein the server function is adapted to provide and control operation features for the plurality of packet-switched telephones; and

[[b)]] a web server function adapted to provide network access to set the operation features of the plurality of packet-switched telephones using a web browser.

33. (Original) The computer readable medium of claim 32 wherein the software is adapted to instruct a control system of a module connected to one of the plurality of packet-switched telephones.

34. (Original) The computer readable medium of claim 32 wherein the software is adapted to instruct a control system of one of the plurality of packet-switched telephones.

35. (Original) The computer readable medium of claim 32 further comprising instructions adapted to cooperate with one of the plurality of packet-switched telephones to initially configure the one of the plurality of packet-switched telephones to work in conjunction with the module via a telephone interface.

36. (Original) The computer readable medium of claim 32 wherein the operation features define provisioned telephony functions for the plurality of packet-switched telephones.

37. (Original) The computer readable medium of claim 32 wherein the operation features define configuration settings for the plurality of packet-switched telephones.

38. (Original) The computer readable medium of claim 32 wherein the operation features control at least one of the group consisting of keys, displays, responses, and functions of the plurality of packet-switched telephones using the first protocol.

39. (Original) The computer readable medium of claim 32 comprising further instructions to enable the web server function to provide at least one web page providing an interface for a user to set select ones of the operation features.

40. (Currently Amended) The computer readable medium of claim 32 comprising further instructions to receive, using the first protocol, an OFF-HOOK message from one of the plurality of packet-switched telephones and generate a message to the remote proxy server including identifying information for a device being called by the one of the plurality of packet-switched telephones ~~enable the server function to provide a terminal proxy server for the plurality of packet-switched telephones~~.

41. (Original) The computer readable medium of claim 32 comprising further instructions to translate between the first and second protocols to facilitate communications between the plurality of packet-switched telephones and the other telephony devices.

42. (Original) The module of claim 32 wherein the second protocol is a Session Initiation Protocol.

43. (Currently Amended) A system for controlling packet-switched telephones comprising:

[[a)]] means for providing a server function in association with a first packet-switched telephone;

[[b)]] means for configuring the first packet-switched telephone and a second packet-switched telephone as clients of the server function;

[[c)]] means for controlling concurrent operation of the first and second packet-switched telephones using the server function; [[and]]

[[d)]] means for facilitating communications between a plurality of packet-switched telephones and other telephony devices with the server function using a first protocol for communications with the plurality of packet-switched telephones and a second protocol for communications with the other telephony devices;

means for registering the server function with a remote proxy server using the second protocol; and

means for registering the first and second packet-switched telephones with the remote proxy server using the second protocol such that the first and second packet-switched telephones may operate concurrently.

44. (Original) The system of claim 43 further comprising means for providing the server function in a module and associating the module with the first packet-switched telephone.

45. (Original) The system of claim 43 wherein the server function is integrated into the first packet-switched telephone.

46. (Currently Amended) The system of claim 43 further comprising:

[[a)]] means for providing a web server to provide a web page configured to receive settings for operation features defining operation of one of the first or second packet-switched telephones;

[[b)]] means for receiving input to set operation features for the one of the first or second packet switched-telephone via the web server; and

[[c)]] means for setting the operation features of the first or second packet-switched telephone based on the input.
